Energy Emergency Communications and Public Advisories

SYNTHETIC EDUCATIONAL DOCUMENT — NOT AN OFFICIAL SOURCE

Purpose: Provide background material for retrieval and chatbot testing in the SmartGrid AI prototype.

This synthetic guide provides a framework for communicating electricity risk to consumers. It is not an official alert protocol and should not be used to imitate official emergency declarations.

1. State the source

Identify whether information comes from a utility, grid operator, government agency, weather service, or an internal predictive model. Do not present an internal model output as an official warning.

2. State the geography

Specify the city, county, utility service area, or grid region covered. Statewide claims should not be inferred from a local event.

3. State the time period

Include when the risk is expected, how long the forecast applies, and when it will be updated. Distinguish current conditions from tomorrow's forecast.

4. Explain uncertainty

Use language such as low, moderate, or elevated model-estimated risk only when the categories have documented definitions. Avoid implying certainty when the model produces a probability.

5. Give practical actions

Offer clear, proportionate actions such as checking utility updates, charging devices, preparing essential supplies, and avoiding downed lines. Do not recommend unsafe electrical work or unverified emergency actions.

6. Accessibility

Use plain language, short sentences, and accessible formats. Consider language access, disability needs, and customers without reliable internet access.

7. Example advisory

"An internal forecast indicates elevated electricity-demand risk for the specified area tomorrow afternoon. This is a model estimate, not an official outage notice. Check your electricity provider and local emergency-management channels for current instructions."

8. Source transparency

When an answer is generated from retrieved documents, list document titles and page references. If the sources do not support a claim, say so and direct users to an authoritative current source.

End of synthetic document. Verify operational facts with current official sources before real-world use.
